DATE OF VISIT: 11/09/2016

Office Clinic Note

Mr. Boucher is a 48-year-old right-handed gentleman I have been asked to see by Nurse Practitioner Tidquist from Jackson Correctional Facility for right shoulder problem. He indicates the shoulder was not working very well, then there was a car accident. Since then it has worked even less well. He has pain with shoulder elevation and motion. He also tells me that he had a biceps tendon tear that was treated surgically. He arrives with an MRI.

Medications reconciled in Cerner.

Vital signs per the nurse's note.

Health screening reviewed; is as per the form that is scanned into the chart.

OBJECTIVE: A pleasant gentleman. Cooperative with examination. Right shoulder is examined. There is fairly obvious atrophy posteriorly. He has remarkably little shoulder motion. Distal neurovascular status is intact.

Plain films are reviewed and demonstrate proximal migration of the humerus with respect to the glenoid. Magnetic resonance imaging study is reviewed, which shows a high-riding humeral head, supraspinatus tear full thickness with marked atrophy and retraction, marked atrophy of the infraspinatus. There is probably an infraspinatus tear. Subscapularis seems to be abnormal also.

**IMPRESSION:** Chronic rotator cuff tear. This appears to be unreparable.

Clinic/Office Documents

PLAN: We talked about what options are available. In my opinion, the rotator cuff tears are unrepairable. Arthroplasty is not a very good option. As a temporizing measure, an injection is offered. After obtaining verbal consent, the right subacromial area was prepped with alcohol, skin freezing spray, and injected with 40 mg of Depo-Medrol and some lidocaine. A Band-Aid is applied. Steroid flare prophylaxis discussed. In the immediate postinjection period, he reports no improvement in his discomfort.

For Nurse Practitioner Tidquist, please monitor his discomfort to see if he has any response to the injection. Parenthetically, it should be noted that failure of response to injection therapy is a grave prognostic indicator for any type of operative intervention.

Thomas W Grossman, MD

### Diagnostic Radiology

ACCESSION	EXAM DATE/TIME	PROCEDURE	ORDERING PROVIDER	STATUS
XR-16-0065207	11/9/2016 10:08 CST	XR Shoulder Complete Right	Grossman Jr. MD, Thomas	Auth (Verified)

#### Reason For Exam

(XR Shoulder Complete Right) Shoulder pain

#### Reference Report

RIGHT SHOULDER THREE VIEWS 11/9/2016 PROVIDER MD Thomas Grossman Jr.

HISTORY: Shoulder pain. Rotator cuff tear.

COMPARISON: None.

VIEWS: AP, Grashey, and scapular Y views of the right shoulder.

FINDINGS: The shoulder joint is mildly narrowed with some inferior humeral spurring. There is only mild elevation of the humeral head. There are some benign lucencies in the humeral head. No fracture or dislocation is seen. The AC joint is maintained.

IMPRESSION: Mild degenerative changes at the shoulder joint and mild elevation of the humeral head relative to the glenoid.
